

Lab : Capturing and Analyzing HTTP Traffic in Wireshark

Objective: To capture and analyze HTTP traffic in Wireshark

Tools required: Kali Linux

Prerequisites: None

Steps to be followed:

1. Generate HTTP traffic in Wireshark and analyze network communication patterns

Step 1: Generate HTTP traffic in Wireshark and analyze network communication patterns

1.1 Click on Kali Virtual Machine and open it

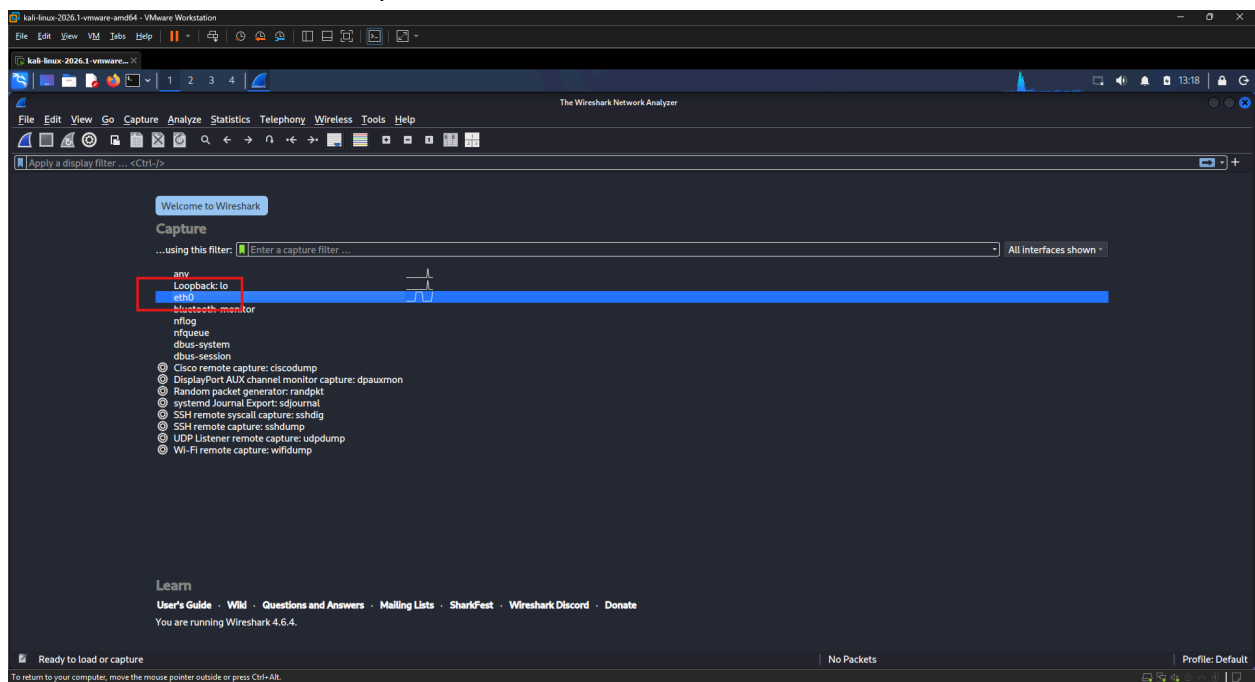

1.2 Login with username and password

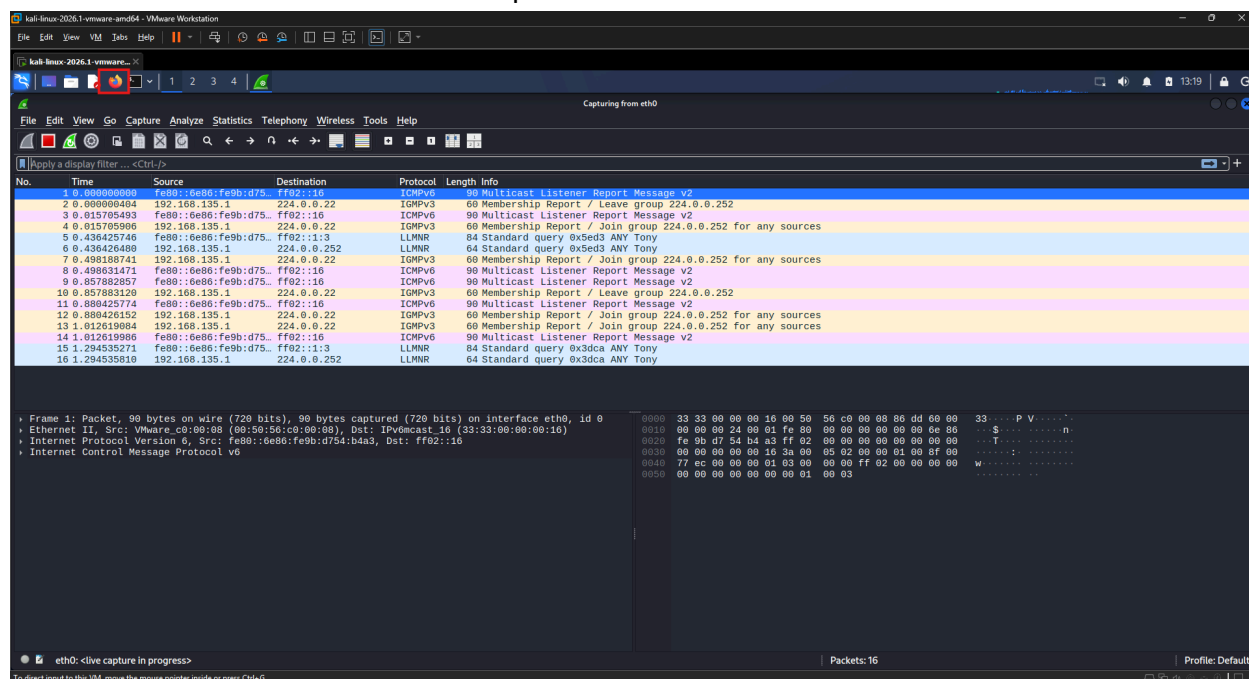

1.3 Open *wireshark*

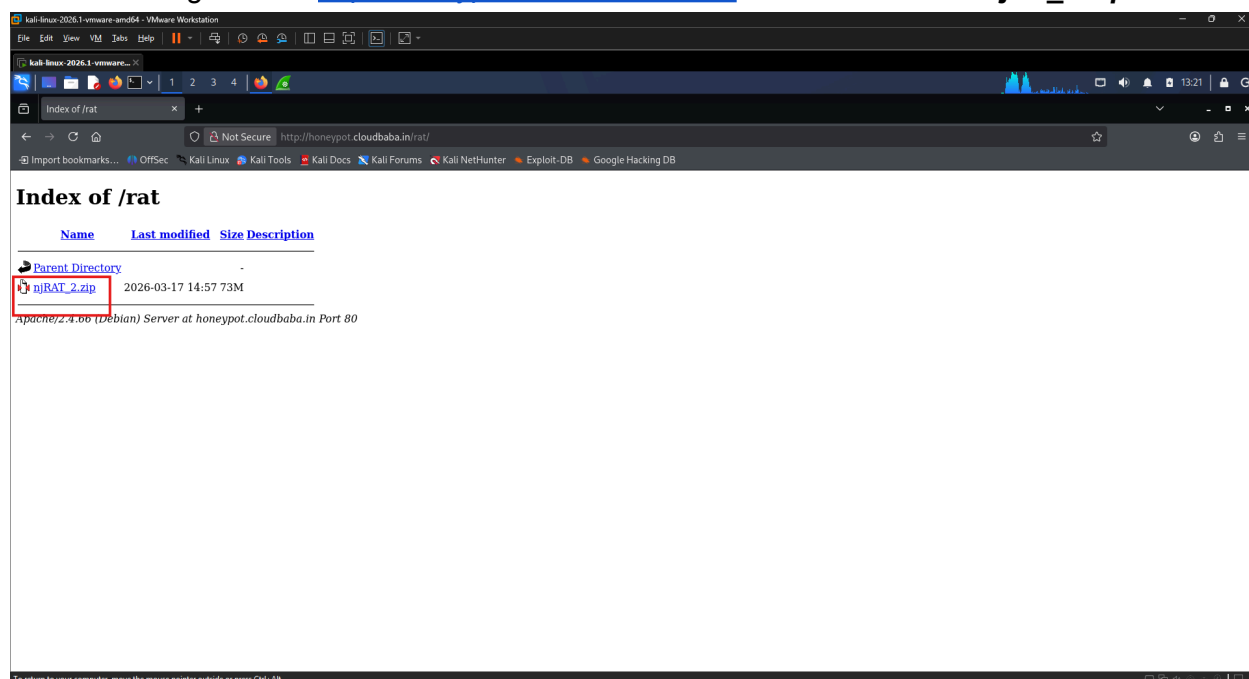

1.4 Double-click on **eth0** to open it

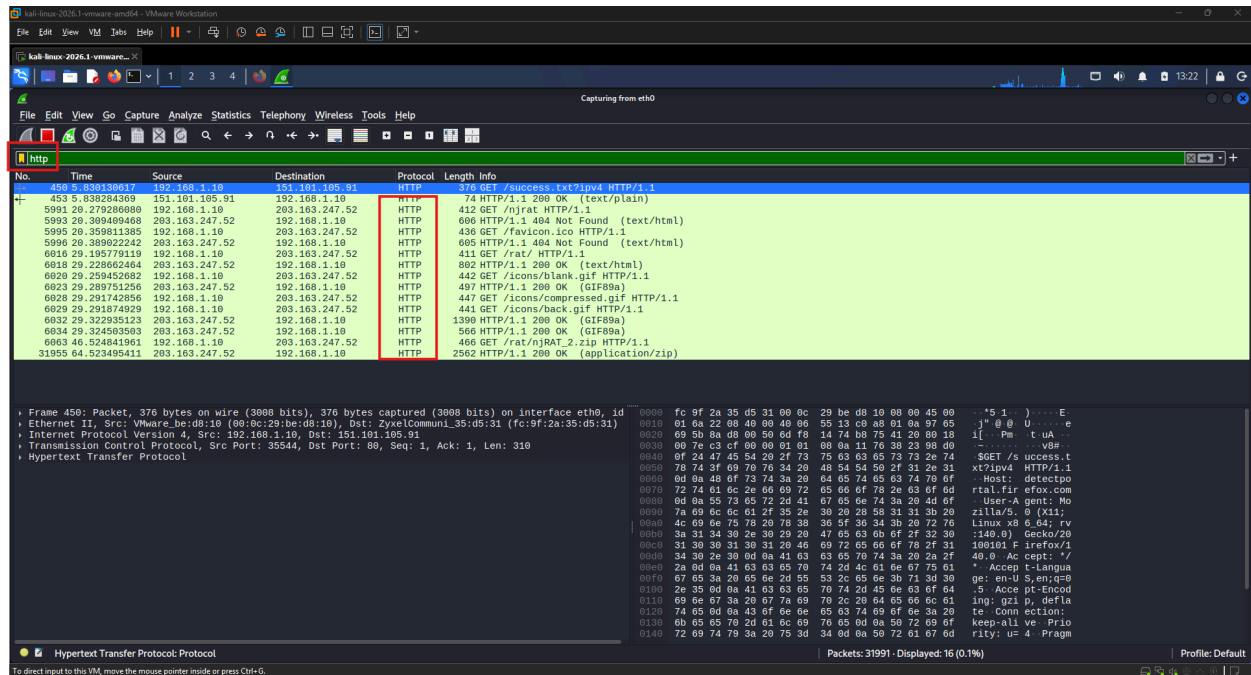

1.5 Click on **Firefox ESR browser** to open it

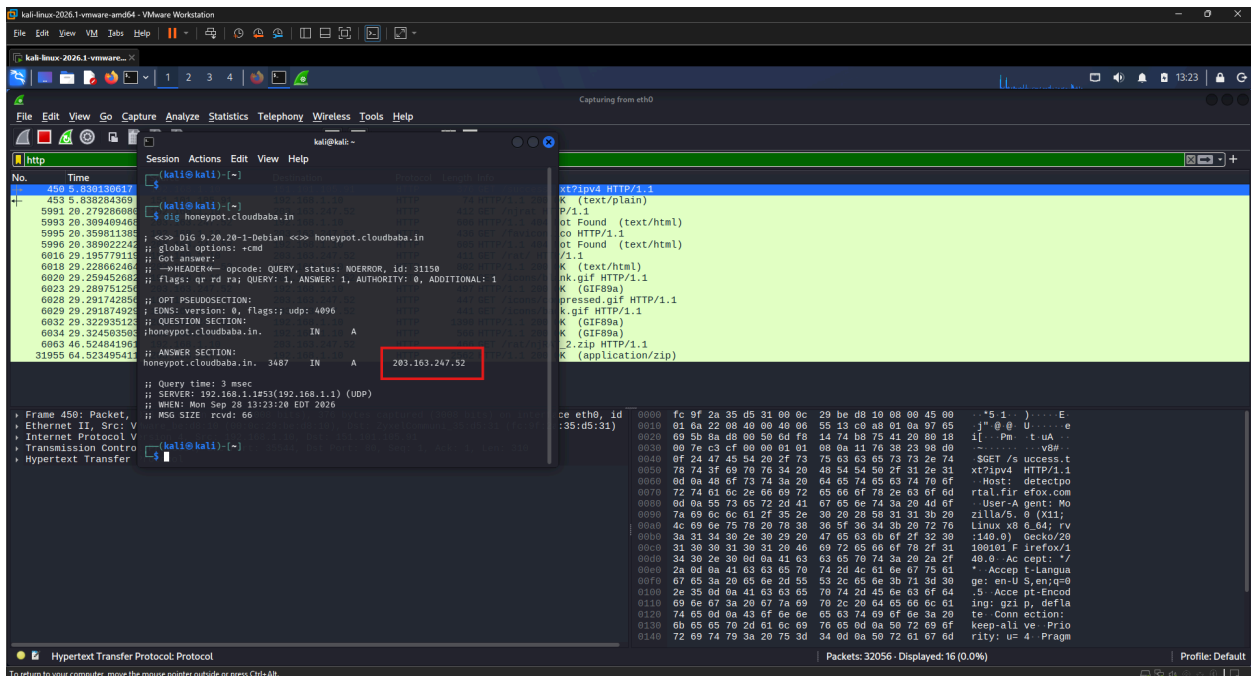

1.6 Paste the given link <http://honeypot.cloudbaba.in/rat/> and download the **njrati_2.zip**

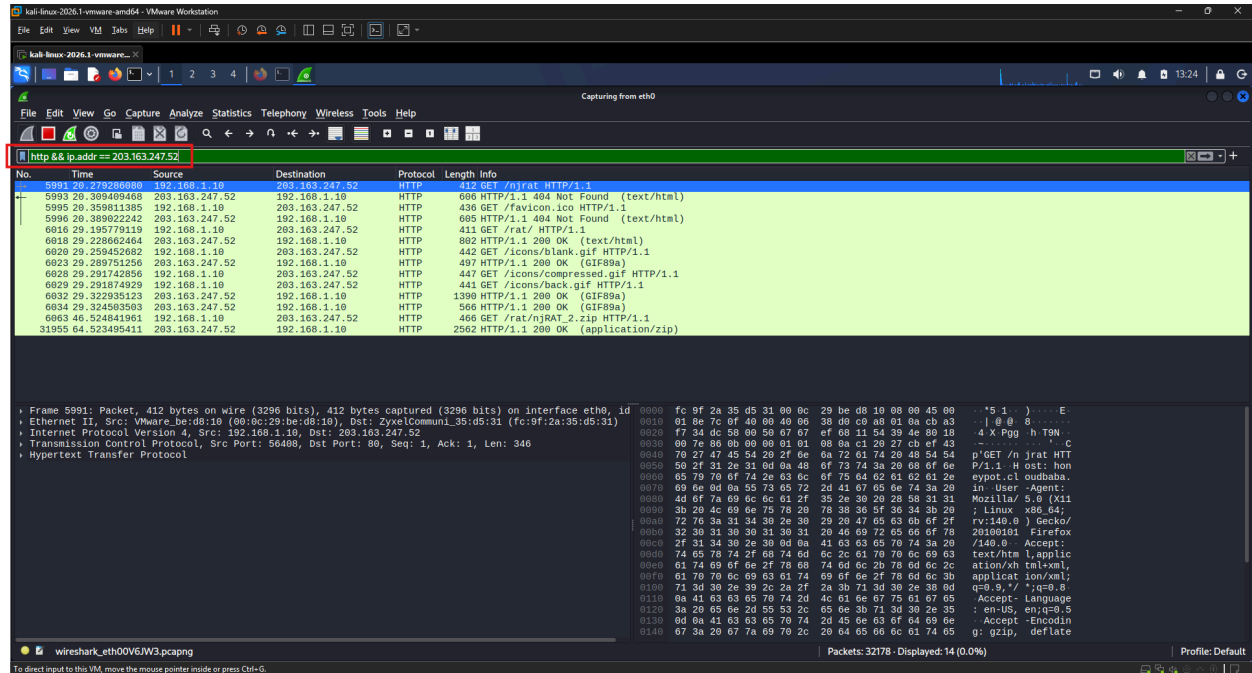

1.7 Browse back to wireshark, type **http** in the filter tab, and press enter to filter the HTTP traffic

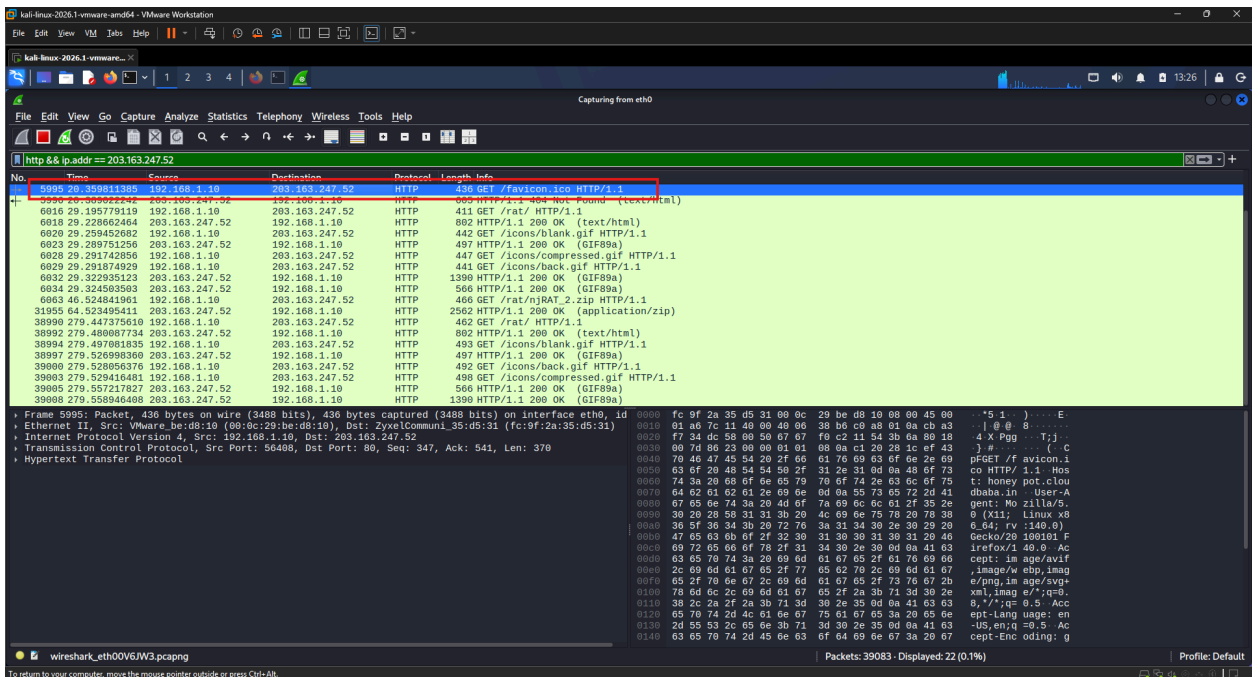

1.8 Run the following command in terminal to gather the DNS information **dig honeypot.cloudbaba.in**

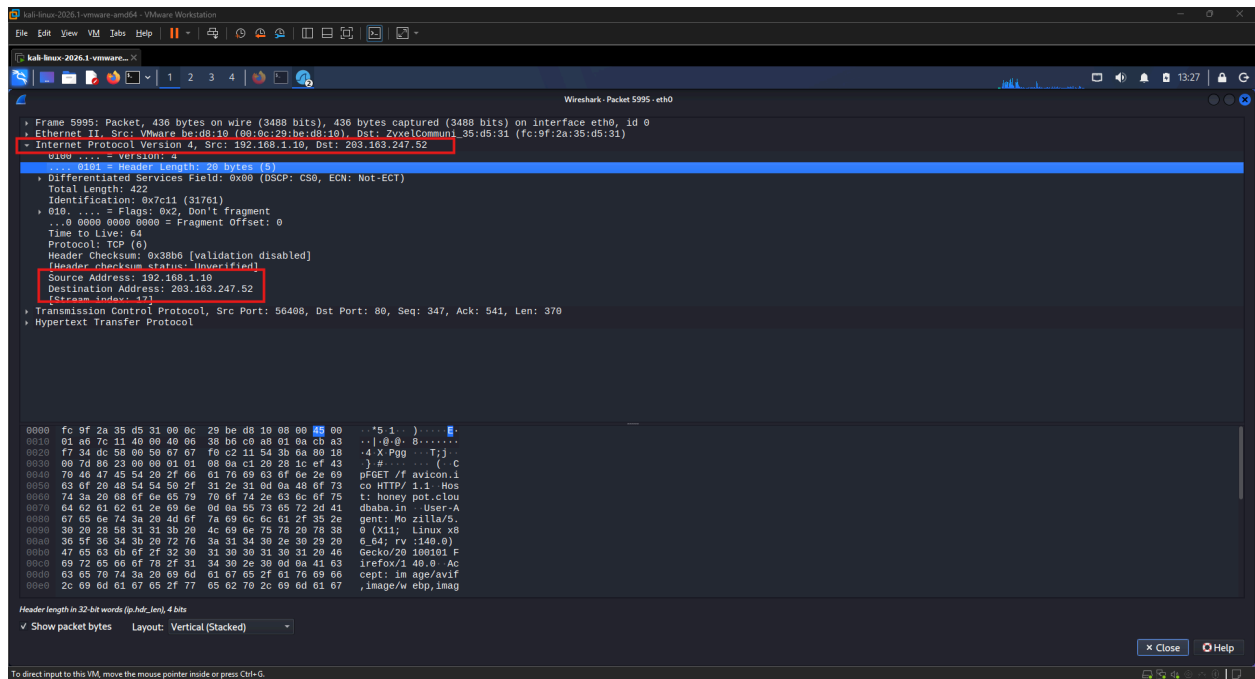

1.9 Copy the answer section and type the following command in the filter section:
http && ip.addr == 203.163.247.52

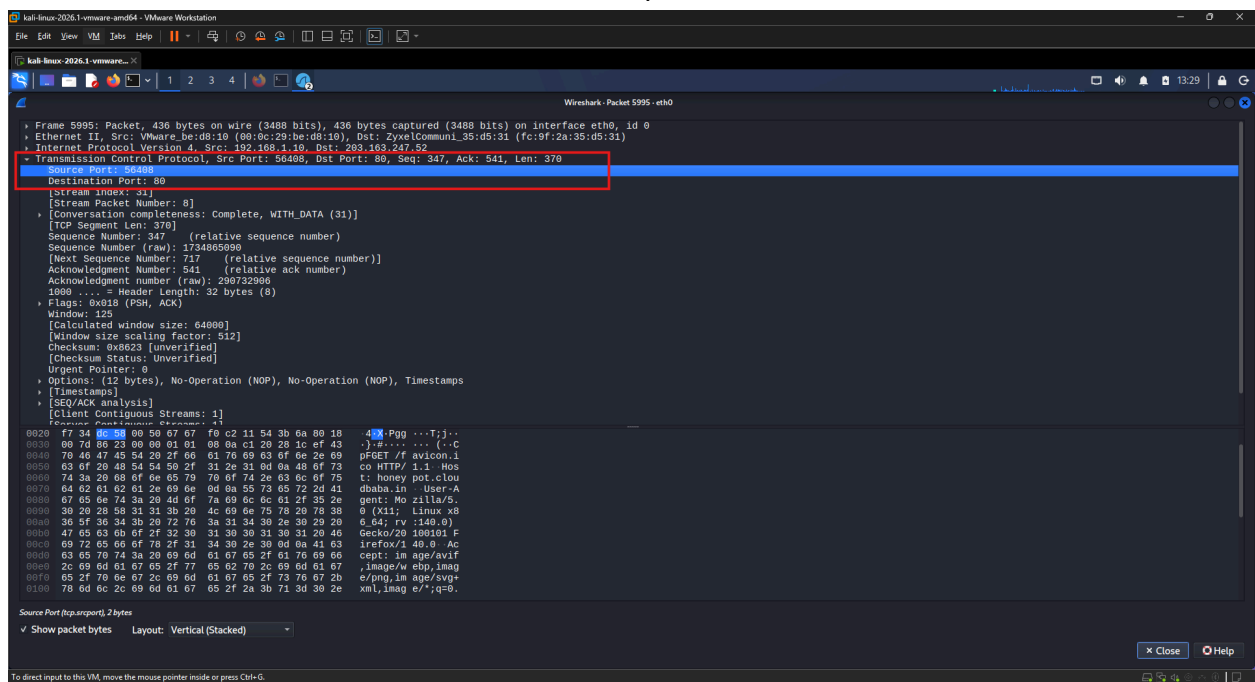

1.10 Double-click on the first packet to open it

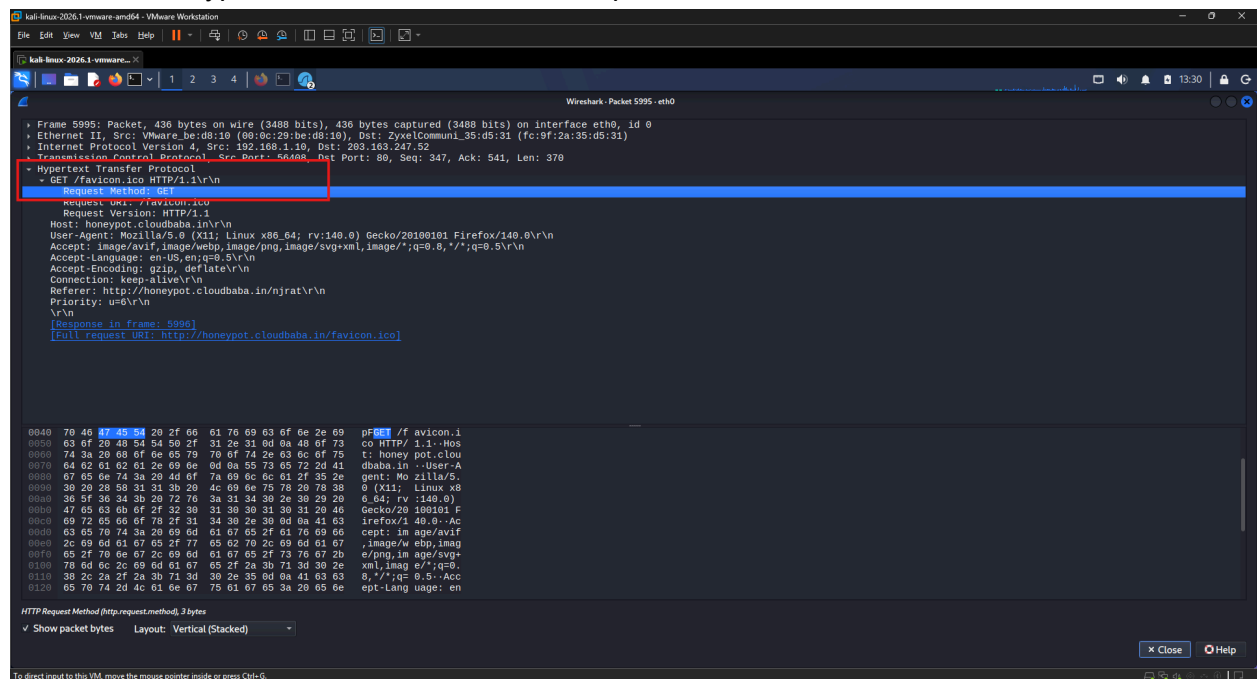

1.11 Click on Internet Protocol Version 4 to expand it

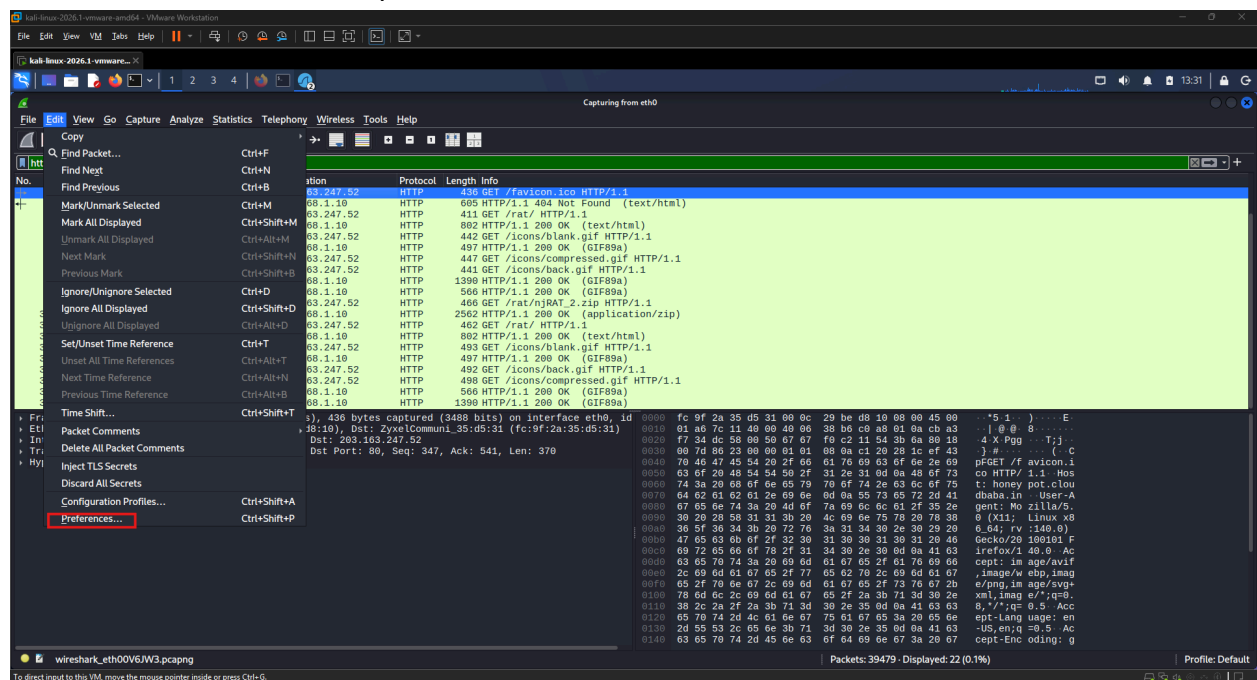

1.12 Click on Transmission Control Protocol to expand it

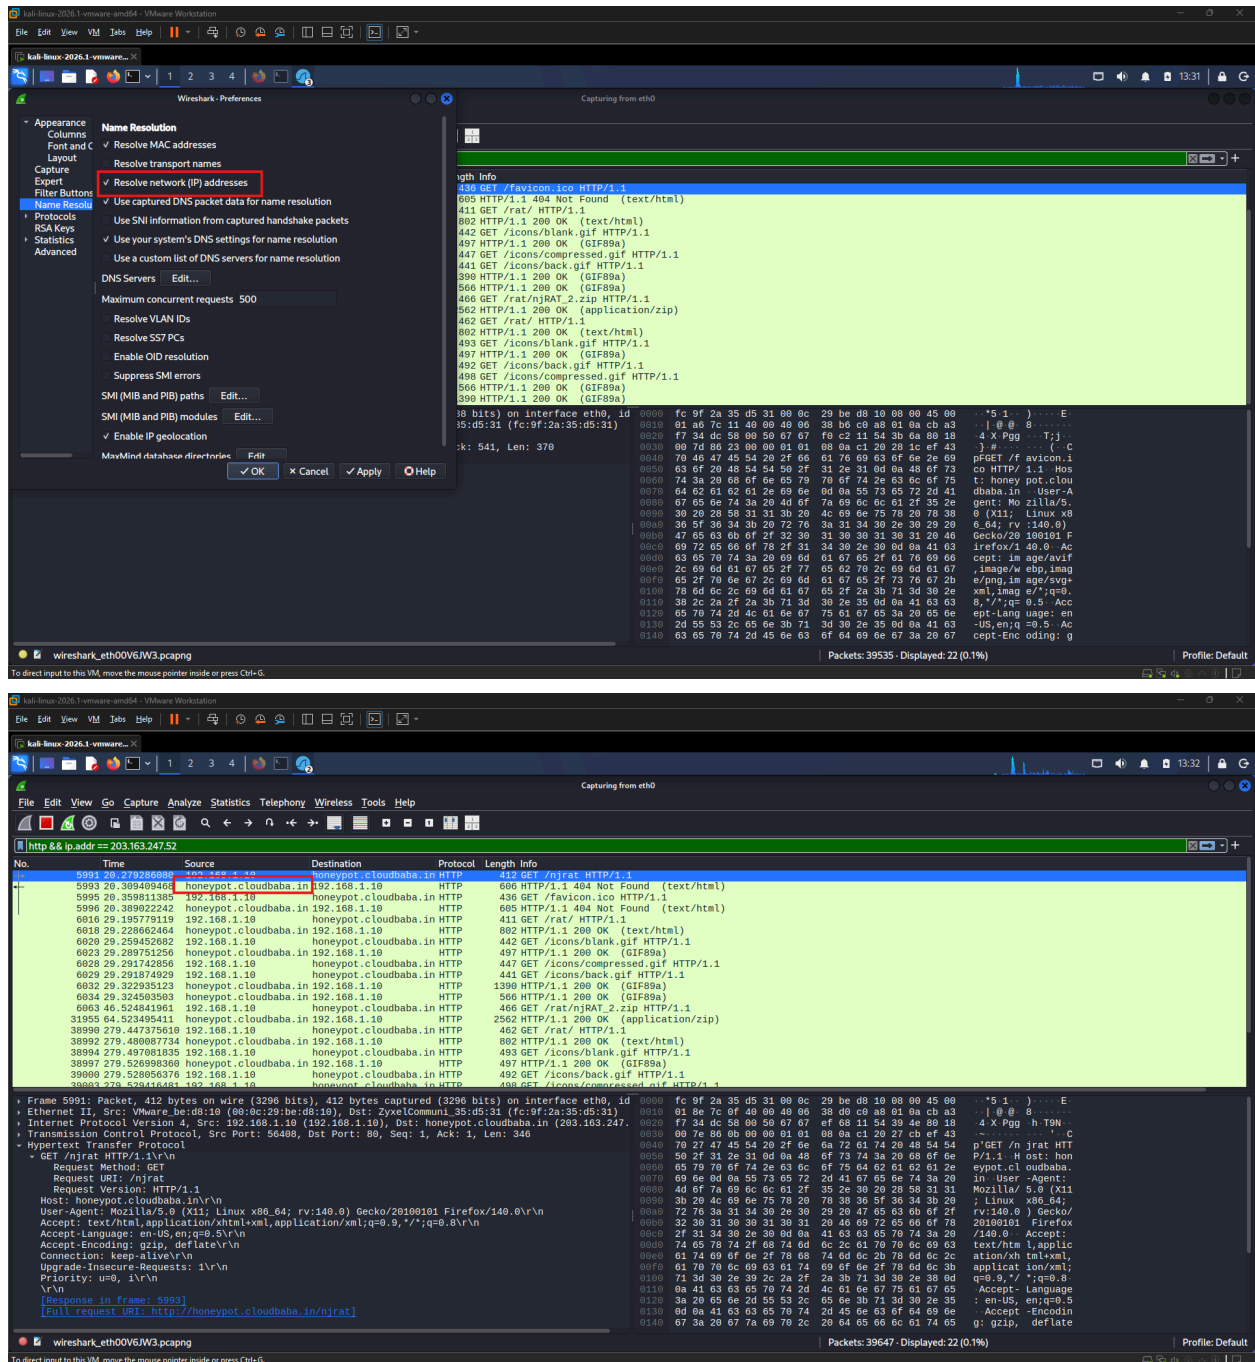

1.13 Click on Hypertext Transfer Protocol to expand it

1.14 Click on edit from the top left corner and select Preferences...

1.15 Select Name Resolution and check the box of **Resolve network (IP) addresses** and click on OK

By following these steps, I have successfully **captured and filtered HTTP traffic using Wireshark**. By analyzing the captured packets, I have uncovered the interactions between clients and servers, especially regarding unencrypted web traffic.
